  mode = "ga", init.artifact.stop = 0.05,

  report.format = "html", verbose = TRUE)
```

Arguments

vcf.file	String value corresponding to input .vcf file. Please provide the full path.
vcf.file.genome	Genome assembly of the input .vcf file. The value should be either 'hg19' or 'hg38'.
config.file	String value corresponding to input configuration file. For more details please refer to ...
df.ref.mut.sigs	A data.frame of the reference mutational signatures
target.mut.sigs	A character vector of the target mutational signatures from reference mutational signatures.
sequencing.artifact.mut.sigs	A character vector of the sequencing artifact mutational signatures from reference mutational signatures.

num.cores	Number of cores to allocate
output.dir	String value of the desired output directory
mode	String value. The value should be either 'ga' or 'manual'.
init.artifact.stop	Numeric value less than 1. If the sum of sequencing artifact weights in the user-specified original VCF file (i.e. vcf.file) is less than or equal to this value then FIREVAT does not perform variant refinement. Default value is 0.05. Note that this option does not apply if 'mode' is 'manual'.
objective.fn	Objective value derivation function. Default: Default.Obj.Fn.
use.suggested.soln	Boolean value. If TRUE, then FIREVAT passes the default values of filter variables declared as 'use_in_filter' in the config file to the 'suggestions' parameter of the Genetic Algorithm package. If FALSE, then FIREVAT supplies NULL to the GA package 'suggestions' parameter. FIREVAT also computes baseline performance of each filter variable and uses fittest population from each variable as a suggested solution.
ga.type	String value. The value should be either 'binray' or 'real-valued'.
ga.pop.size	Integer value of the Genetic Algorithm 'population size' parameter. Default: 200. This value should be set based on the number of filter parameters. Recommendation: 40 per filter parameter.

mutalisk.random.sampling.max.iter	Mutalisk random sampling maximum iteration. Default: 10. The number of times Mutalisk randomly samples from target.mut.sigs before determining the candidate signatures.
