<code>num.cores</code>	Number of cores to allocate
<code>output.dir</code>	String value of the desired output directory
<code>mode</code>	String value. The value should be either 'ga' or 'manual'.
<code>init.artifact.stop</code>	Numeric value less than 1. If the sum of sequencing artifact weights in the user-specified original VCF file (i.e. <code>vcf.file</code>) is less than or equal to this value then FIREVAT does not perform variant refinement. Default value is 0.05. Note that this option does not apply if 'mode' is 'manual'.
<code>objective.fn</code>	Objective value derivation function. Default: <code>Default.Obj.Fn</code> .
<code>use.suggested.soln</code>	Boolean value. If TRUE, then FIREVAT passes the default values of filter variables declared as 'use_in_filter' in the config file to the 'suggestions' parameter of the Genetic Algorithm package. If FALSE, then FIREVAT supplies NULL to the GA package 'suggestions' parameter. FIREVAT also computes baseline performance of each filter variable and uses fittest population from each variable as a suggested solution.
<code>ga.type</code>	String value. The value should be either 'binray' or 'real-valued'.
<code>ga.pop.size</code>	Integer value of the Genetic Algorithm 'population size' parameter. Default: 100. This value should be set based on the number of filter parameters. Recommendation: 40 per filter parameter.
